

Care Instructions

Wet Areas • Cleaning Compact Laminate

DAILYCLEANING

01 / Washing

Use a neutral or slightly alkaline cleaning solution with a pH of 7–9, mixed with cold or lukewarm water. The solution can be mixed in a bucket or spray bottle. Apply the cleaning solution with a cloth, sponge, or small low-pressure sprayer, and let it sit. Gently treat any stains with a nylon cloth. Then wipe the surface with a well-wrung-out disinfectant cloth.

02 / Disinfection

With regular and thorough cleaning, disinfection is not normally necessary. However, disinfection may be necessary in the event of contagious diseases or infections, or when healthcare professionals have established specific requirements.

TIP! Apply the cleaning solution first to the dirtiest areas, so it has as much time as possible to work.

HEAVYCLEANING

03 / Lime and Mineral Deposits

Use an acidic cleaner with a pH of 1–5, mixed with cold water. The solution can be mixed in a bucket or applied with a low-pressure sprayer. For vertical surfaces, a thick, viscous cleaner is recommended, as it adheres better to the surface.

Apply the cleaning solution, diluted if necessary according to the instructions, and let it sit. Gently scrub stubborn dirt with a brush or nylon sponge. Rinse thoroughly with cold water and, if necessary, dry the surface with a well-wrung-out hygiene cloth or a chamois.

04 / Grease and Dirt

Use an alkaline cleaner with a pH of 9–14. Otherwise, follow the same cleaning instructions described above.

Remember: On vertical surfaces, apply the cleaner from the bottom up, from the floor toward the ceiling, to reduce the risk of streaks.

Note: Strongly acidic and alkaline cleaning agents can be irritating or corrosive. Therefore, avoid application equipment that creates a spray mist, as well as the use of hot water, since it can create steam or mist. Always use the prescribed personal protective equipment and follow the cleaning agent's safety instructions.
