

Care Instructions

Wet Areas • Cleaning Plexiglass

DAILY CLEANING

01 / Washing

Plexiglas is easy to clean. Use a soft sponge or a microfiber or 100% cotton cloth. Clean only with lukewarm water and dish soap or a cleaner specifically designed for acrylic. Avoid organic solvents as well as acidic and alkaline cleaners, as these can damage the material. A pressure washer may be used with caution. Important for Plexiglas: Avoid abrasive cleaners, coarse sponges, and solvents that can scratch or damage the surface.

02 / Disinfection

With regular and thorough cleaning, disinfection is not normally necessary. However, disinfection may be necessary in the event of contagious diseases or infections, or when healthcare professionals have established specific requirements.

TIP! Apply the cleaning solution first to the dirtiest areas, so it has as much time as possible to work.

HEAVY CLEANING

03 / Lime and Mineral Deposits

Gently clean the surface with lukewarm water and dish soap or a cleaner specifically designed for acrylic. Use a soft sponge or a microfiber or 100% cotton cloth. Rinse thoroughly with clean water and gently dry with a clean, soft cloth.

Important: Do not use acidic or alkaline cleaners, organic solvents, or other products not approved for acrylic, as they may damage the material.

04 / Grease and Dirt

Clean the surface with lukewarm water and dish soap or a cleaning product specifically designed for acrylic. Use a soft sponge or a microfiber or 100% cotton cloth. If necessary, rinse with clean water and gently dry with a clean, soft cloth.

Remember: Avoid organic solvents, acidic and alkaline cleaners, and abrasive tools, as they can damage the plexiglass.

Note: Use only cleaning agents that are suitable for plexiglass, and always follow the manufacturer's instructions. Avoid products that could damage the material. Follow the cleaning agent's safety instructions and use the recommended personal protective equipment as needed.
